ObjectFrontier Releases new product, EJB 2.0

March, 2001, Chennai: Chennai based ObjectFrontier announced the release of its ePersistJ, an EJB 2.0 compliant persistence manager platform is optimized for Java 2 Enterprise Edition (J2EE) Applications, providing a sophisticated and flexible development and deployment environment and a powerful, highly configurable and scalable run-time environment. EPersistJ builds upon PersistJ released in 1999.

“For enterprises dealing with the challenge of increasing technology demands while cutting costs and time to market, ePersistJ delivers up to 70% savings in development time and money by automating a large part of the development effort when using an object model. It goes well beyond an Object Relational Mapper”, said Steve Borte, Senior Partner at ObjectFrontier, USA.

To improve IT performance and productivity, the ePersistJ development environment includes a Modeler, Class Builder and Fusion Builder, ePersistJ modeler is an easy-to-use, Extensible Markup Language (XML)- based development tool, enabling an enterprise to rapidly model the complex relationships between entity beans and development objects using UML notations. With ePersistJ Class Builder, an enterprise can generate code for the EJB 2.0 platform and add business rules. Significant time and resource savings are achieved by using the ePersistJ Fusion Builder that maps beans, dependant objects and complex relationships among them to any medium (relational database, ERP, JNDI and mainframe) with a single click.

EPersistJ Runtime, an EJB 2.0 compliant persistence manager, can be configured to handle both Bean Managed Persistence (BMP) and Container Managed Persistence (CMP). Built on Java Connector Architecture (JCA), ePersistJ Runtime is capable of persisting beans and dependant objects in any medium (relational database, ERP, JNDI and mainframe). EPersistJ Runtime supports distributed caching through Java Messaging Service (JMS) notification, which facilitates highly scalable architecture for any enterprise.

About ObjectFrontier

ObjectFrontier is a provider of comprehensive software solutions, components and service oriented enterprise software to the global clients through an appropriate combination of software products and multi-dimensional IT services. ObjectFrontier's robust and scalable products can be used independently or in combination with ObjectFrontier services.

ObjectFrontier's core strength arises from its highly successful **SunTone certified, O/R mapping product, FrontierSuite for J2EE v 3.1 (CMP/JDO/FCM), which is a persistence framework.** This specialization is a highly complex and niche technology that empowers it to deliver highly innovative solutions to client problems quickly, effectively and qualitatively. Providing the clients with software projects and products with implementations in diverse fields like Finance, Banking, Insurance and Manufacturing has been ObjectFrontier's main domain.
